news aggregator: *an online platform that collects news stories and other information as it is published and organises it in a specific manner for ease of access and viewing*

Future Electric

New technology has been tested in the US to enable electric vehicles to power homes, an idea already being explored for electric boats. Boats sitting in a marina between outings continue to generate power from their deck-mounted renewables (solar and wind), usually storing this power in a large battery bank. Excess power is often burned off and wasted as heat through a 'dump regulator' system. It has long been proposed that boat owners could sell their power back to the grid via a bi-directional shore power hook up, and several companies such as Aqua Superpower have been exploring this approach. The idea is that there should be a universally compatible platform so almost all electric vehicles will be able to harness their battery capacity as a domestic energy reserve.
